

## Press Release

Zurich, 22 November 2018

### Web App Delivery with oneclick™

**With the current release, web applications can be integrated into the oneclick™ workspace and are secured with the built-in security mechanisms.**

The latest extension of the Workspace Provisioning and Streaming Platform oneclick™ is Web App Delivery. Thanks to this function, it is possible to make web applications and websites, e.g. internal sharepoints, ERP systems or industry software, securely available via mobile devices. By connecting to oneclick™, web apps are secured with the security mechanisms of the platform.

With oneclick™ Web App Delivery, users not only secure their internal web applications but they are also able to integrate additional websites into the consistent workspace of oneclick™. The registration is carried out via an automated log-in process. Hence, the user only requires one password to enter the oneclick™ platform and will be logged into every integrated web application automatically, as soon as it is opened.

oneclick™ is an immediately applicable Platform-as-a-Service (PaaS) for the deployment of digital workspaces. Web apps, native applications, desktops and data are centralised from different environments – e.g. on-premise, cloud or web – in the platform and are delivered securely to the users via streaming.

“Internal company web applications contain sensitive information and are thus especially worth protecting. Usually this applies to legacy web applications that are not being developed further and therefore do not conform to essential security standards anymore. It takes a lot of effort to make such applications securely and mobile accessible for employees”, says Florian Bodner, CIO of oneclick AG. “With oneclick Web App Delivery, we offer an ideal solution for this use case. Our platform simplifies the mobile access to web applications and secures them at the same time.”

Thanks to oneclick™ Web App Delivery, the user only connects to the oneclick™ platform instead of directly connecting to the web application or the associated data they wish to access. The web application is opened in an isolated environment and will be displayed to the user via an encrypted stream.
