

Supporting companies in complying with the general data protection regulation.

Increased protection against unauthorised access and misuse of personal data

New requirements for the protection of personal data normally require a reorganisation of business processes and working methods.

With the Workspace Provisioning and Streaming Platform oneclick™ for easy and secure remote access, **no major changes to IT infrastructures are required**: oneclick™ streams work interfaces and data to stationary and mobile end devices, ensuring that **personal information is transmitted in encrypted form** and is not accidentally stored outside the company in files on end devices. The use of oneclick™ does not require the installation of clients or plug-ins on servers or end devices.

Via **controllable access authorisations and restrictions** for the applications, personal data are protected by a further factor. And since all transactions are transparent and traceable, companies are on the safe side with oneclick™ with regard to their new documentation obligation with regard to the EU general data protection regulation.

Curious?

We will be happy to advise you on your individual starting position. Take a look at oneclick™ at any time without obligation in a webinar or try out all the functions for yourself.

oneclick™ contains all components of a DMZ:

- Firewall
- Virtual Private Network
- Application Delivery Control
- Proxies
- Identity and Access Management
- Two-factor authentication
- Controllable access rights
- Transparency and traceability through logging (Documentation)

oneclick™ meets all requirements with regard to transparency, security, quality and legal conformity. Tested by Capgemini on behalf of the Federal Ministry of Economics and Energy.

„When using our platform, personal data is neither stored in the cache nor in the log files of applications on the end devices.“

Dominik Birgelen, CEO der oneclick AG
